Volleyball sanction system
Documentation

Christopher Falcone, Noah Vaillancourt, Andrew Sammons
3/15/26

Goal 1: Code refactoring/Removing Dead Code/Moving to GitHub

The goal is to refactor the code and clean it up to make it more efficient and diminish the bugs in the code. Then it will be transferred to GitHub, to make it more accessible for Professor Matthews and us.

- Refactor the code to make it more easily readable and get rid of some bugs
- Remove dead code to make the code more efficient and get rid of some bugs
- Transfer code to GitHub for accessibility

Goal 2: SportsEngine API Integration

This goal defines the integration of the SportsEngine API into the project to pull member data. The more explicit use of the SportsEngine API will be to:

- Pull member data
- Cache member records locally in a database
- Cached data will be used to:
    - Control which users are allowed to access the system
    - Perform basic eligibility checks for club administrators
    - Replace user-based dropdowns and selection lists throughout the application (clubs, contacts, members, etc.)

The data that is currently gathered per member record is:

- club_code
- persona_id
- membership_number
- first_name
- last_name
- membership_name
- eligibility_status
- email
- _key (“persona:” + persona_id)

The API uses GraphQL as its query language. The use of the SportsEngine API is documented on their website: SportsEngine API

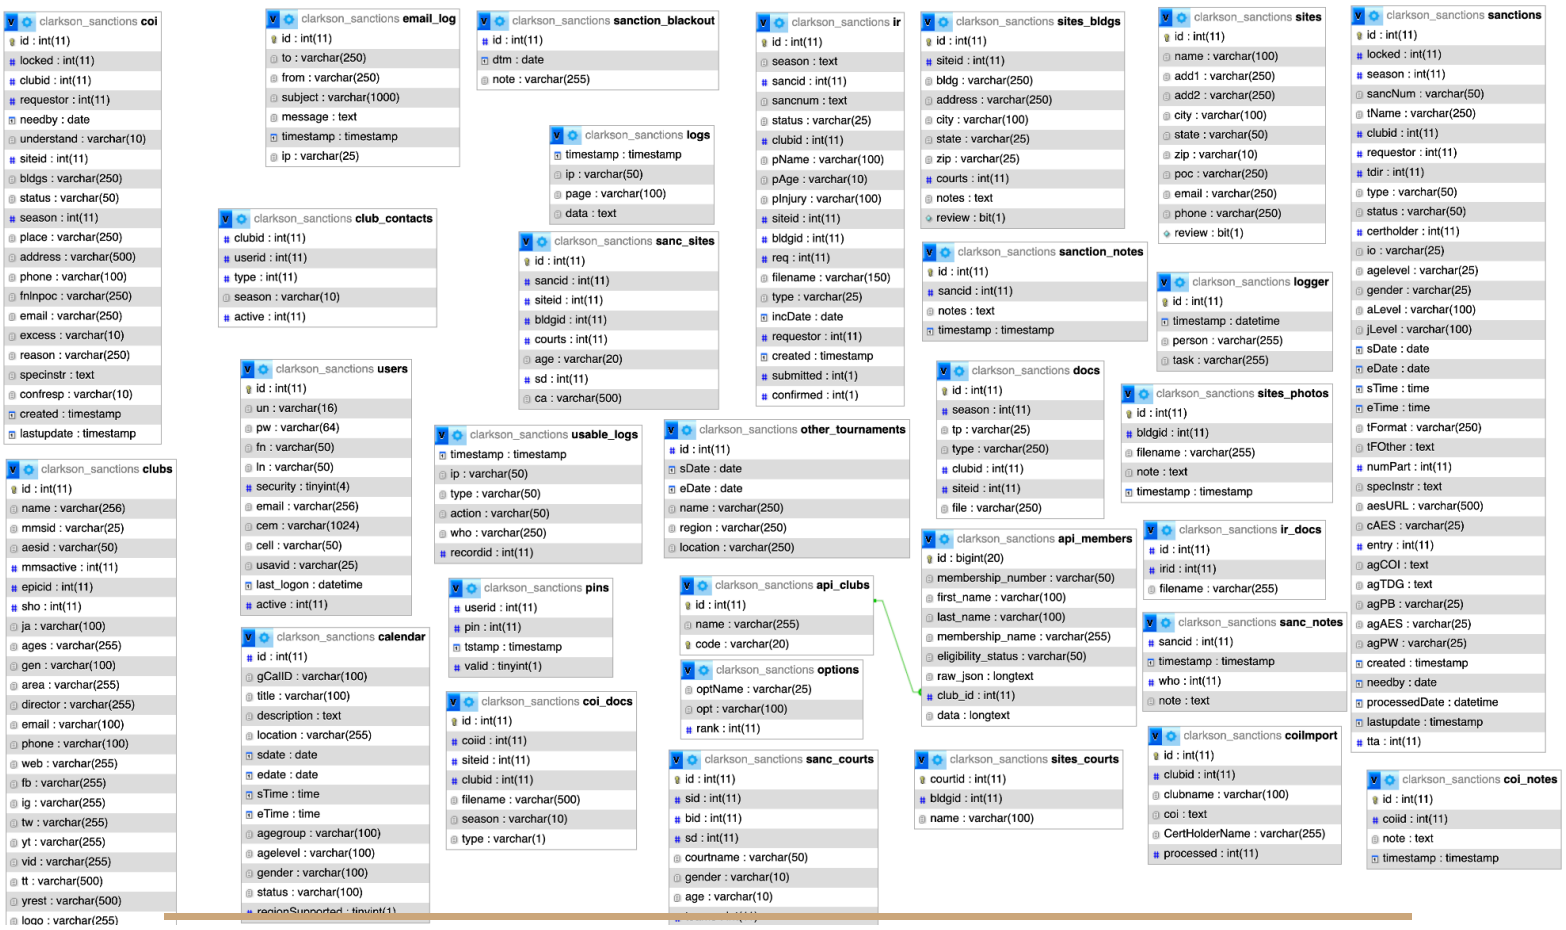
For our purposes we will mainly just use a readme (in the API directory) or good comments in the code that makes the api calls to document for future developers.

Goal 3: version 3 upgrade (front-end)

This goal focuses on the integration of “version 3” which has already started development and plans to completely overhaul the user interface for administrators.

If time does not permit pursuing this, then making slight changes to the current version could still be very helpful. Most of the current systems issues come down to not visually indicating something to the user (example: in some scenarios an admin without permission can attempt to edit something but nothing will happen). Another large priority would be allowing teams to edit their sanction requests after submission; since once they are submitted they must be manually unlocked by sending an email, and Scott unlocking their request himself.

Step through of the current and new administrator user interface
(step 64 shows the new version with the new-admin template)

Database Schema


Here is the relational schema of the current database, as we can see it is kind of a mess and also barely has any relationships between entities; there are some obvious inefficiencies with this, for example user_id is used in multiple entities, but they could all just have a relation with the user entity and take a user_id as a foreign key. Despite this problem, it would be a large hassle to revamp this, especially since there is pre-existing data already in place. So it will be outside our scope of improvements to the system unless time allows.
